ISLR Chapter 3 R Lab

Aditya Dahiya

01/02/2021

3.6.1 *Libraries*

```
knitr::opts_chunk$set(echo = TRUE)
library(MASS)
library(ISLR)
library(car)
```

3.6.2 Simple Linear Regression

```
data(Boston)
names(Boston)
```

```
##  [1] "crim"    "zn"      "indus"   "chas"    "nox"     "rm"      "age"
##  [8] "dis"     "rad"     "tax"     "ptratio" "black"   "lstat"   "medv"
```

```
lm.fit <- lm(medv ~ lstat, data = Boston)
attach(Boston)
```

Displaying the results of simple linear regression of `medv` on `lstat`.

```
lm.fit
```

```
##
## Call:
## lm(formula = medv ~ lstat, data = Boston)
##
## Coefficients:
## (Intercept)        lstat
##       34.55        -0.95
```

```
summary(lm.fit)
```

```
##
## Call:
## lm(formula = medv ~ lstat, data = Boston)
##
```

```
## Residuals:
##     Min      1Q  Median      3Q     Max
## -15.168  -3.990  -1.318   2.034  24.500
##
## Coefficients:
##             Estimate Std. Error t value Pr(>|t|)
## (Intercept) 34.55384    0.56263   61.41   <2e-16 ***
## lstat       -0.95005    0.03873  -24.53   <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 6.216 on 504 degrees of freedom
## Multiple R-squared:  0.5441, Adjusted R-squared:  0.5432
## F-statistic: 601.6 on 1 and 504 DF,  p-value: < 2.2e-16
```

The contents of lm.fit can be displayed as :—

```
names(lm.fit)
```

```
##  [1] "coefficients"  "residuals"     "effects"       "rank"
##  [5] "fitted.values" "assign"        "qr"            "df.residual"
##  [9] "xlevels"       "call"          "terms"         "model"
```

```
coef(lm.fit)
```

```
## (Intercept)       lstat
##  34.5538409  -0.9500494
```

```
confint(lm.fit)
```

```
##                 2.5 %     97.5 %
## (Intercept) 33.448457 35.6592247
## lstat       -1.026148 -0.8739505
```

Using the predict function for predicting the values of `medv` for a given value(s) of `lstat` :—

```
predict(lm.fit, data.frame(lstat=c(5,10,15)), interval = "confidence")
```

```
##        fit      lwr      upr
## 1 29.80359 29.00741 30.59978
## 2 25.05335 24.47413 25.63256
## 3 20.30310 19.73159 20.87461
```

```
predict(lm.fit, data.frame(lstat=c(5,10,15)), interval = "prediction")
```

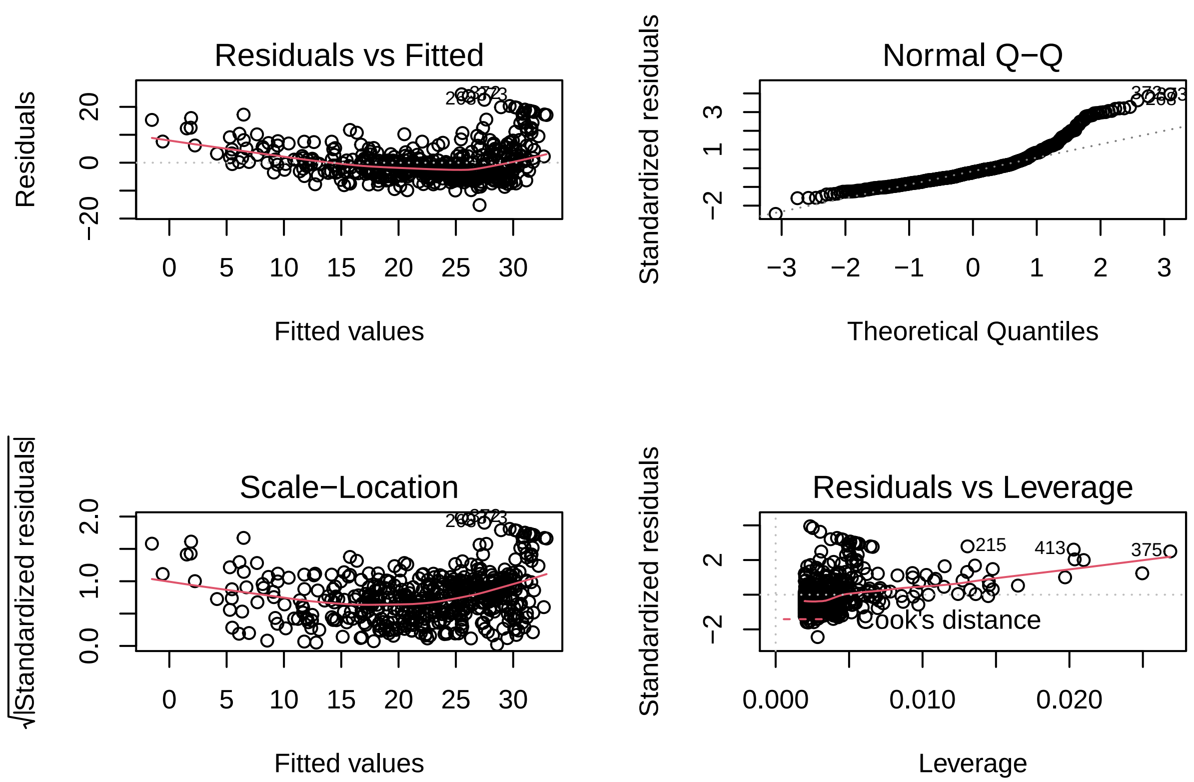
```
##        fit       lwr      upr
## 1 29.80359 17.565675 42.04151
## 2 25.05335 12.827626 37.27907
## 3 20.30310  8.077742 32.52846
```

The plot of `medv` with `lstat` along with least squares regression line is as follows:-

```
plot(x=lstat, y=medv)
abline(lm.fit, col="red")
plot(x=lstat, y=medv, pch=20)
plot(x=lstat, y=medv, pch="+")
abline(lm.fit, col="red", lwd=3)
plot(1:20, 1:20, pch=1:20)
```

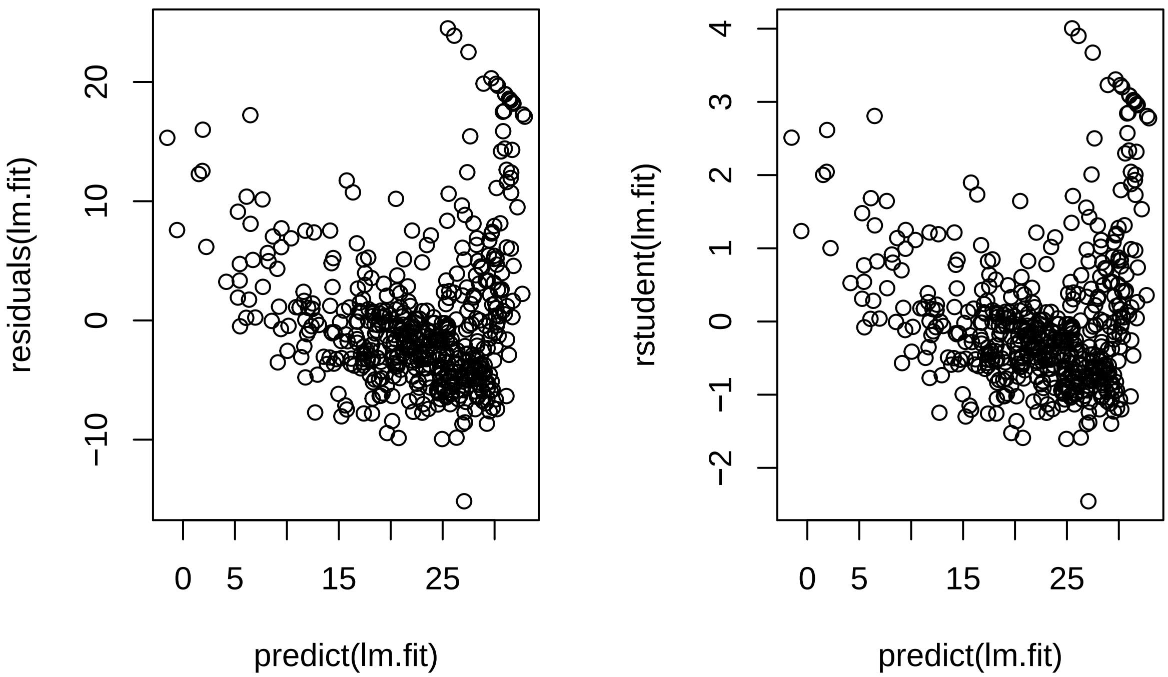
Plotting the 4 diagnostic plots of `lm.fit`:—

```
par(mfrow=c(2,2))
plot(lm.fit)
```



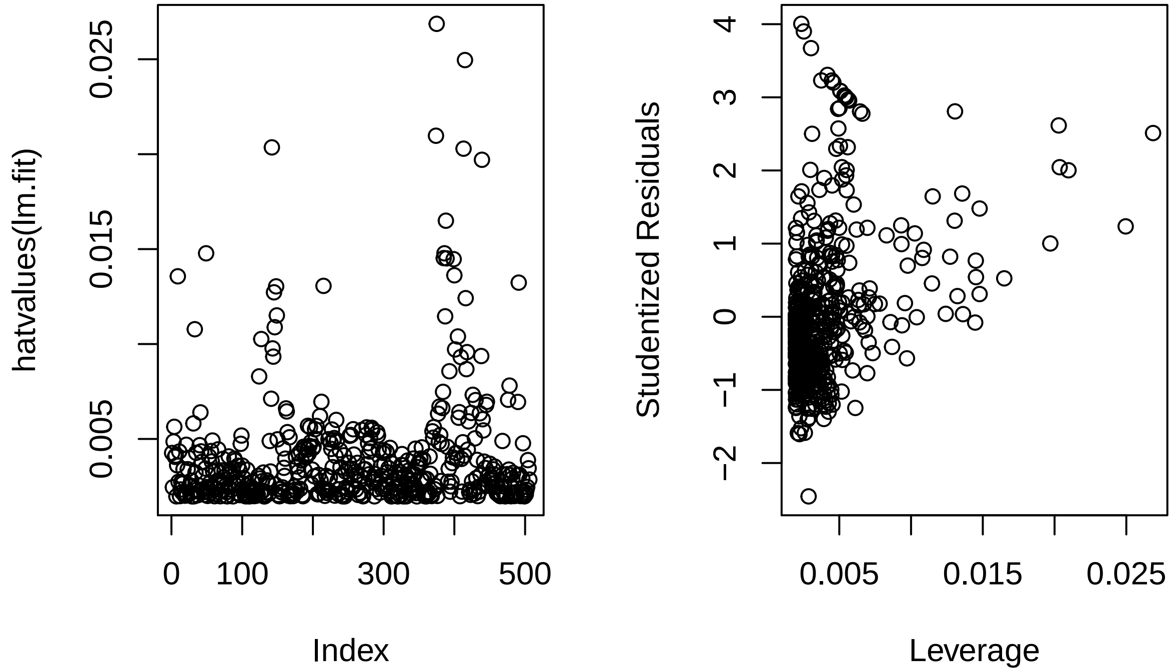
Alternatively, we can plot the residuals vs. fitted values; and studentized residuals vs. fitted values as follows: —

```
par(mfrow=c(1,2))
plot(x=predict(lm.fit), y=residuals(lm.fit))
plot(x=predict(lm.fit), y=rstudent(lm.fit))
```



Now, we calculate the leverage statistics using `hatvalues` function. The largest leverage is for the observation number 375. Also, I plot the studentized residuals vs. leverage statistic, just like Fig.3.13(right) in the book :–

```
par(mfrow=c(1,2))
plot(hatvalues(lm.fit))
plot(x=hatvalues(lm.fit), y=rstudent(lm.fit),
     xlab = "Leverage", ylab="Studentized Residuals")
```



```
which.max(hatvalues(lm.fit))
```

```
## 375
## 375
```

3.6.3 Multiple Linear Regression

Fitting a multiple linear regression as follows:-

```
lm.fit <- lm(medv ~ lstat + age, data = Boston)
summary(lm.fit)
```

```
##
## Call:
## lm(formula = medv ~ lstat + age, data = Boston)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -15.981  -3.978  -1.283   1.968  23.158
##
## Coefficients:
##             Estimate Std. Error t value Pr(>|t|)
## (Intercept) 33.22276    0.73085  45.458  < 2e-16 ***
## lstat       -1.03207    0.04819 -21.416  < 2e-16 ***
```

```
## age          0.03454    0.01223   2.826  0.00491 **
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 6.173 on 503 degrees of freedom
## Multiple R-squared:  0.5513, Adjusted R-squared:  0.5495
## F-statistic:   309 on 2 and 503 DF,  p-value: < 2.2e-16
```

Performing regression of `medv` on all other variables :—

```
lm.fit <- lm(medv ~ ., data=Boston)
summary(lm.fit)
```

```
##
## Call:
## lm(formula = medv ~ ., data = Boston)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -15.595  -2.730  -0.518   1.777  26.199
##
## Coefficients:
##               Estimate Std. Error t value Pr(>|t|)
## (Intercept)  3.646e+01  5.103e+00   7.144 3.28e-12 ***

## Residual standard error: 4.745 on 492 degrees of freedom
## Multiple R-squared:  0.7406, Adjusted R-squared:  0.7338
## F-statistic: 108.1 on 13 and 492 DF,  p-value: < 2.2e-16
```

The components of `summary(lm.fit)` are :–

```
names(summary(lm.fit))
```

```
##  [1] "call"          "terms"         "residuals"     "coefficients"
##  [5] "aliased"       "sigma"         "df"            "r.squared"
##  [9] "adj.r.squared" "fstatistic"    "cov.unscaled"
```

```
summary(lm.fit)$r.squared ; summary(lm.fit)$sigma
```

```
## [1] 0.7406427
```

```
## [1] 4.745298
```

Calculating V.I.F from `car::vif()` from the `car` package :—

```
car::vif(lm.fit)
```

```
##     crim       zn    indus     chas      nox       rm      age      dis
## 1.792192 2.298758 3.991596 1.073995 4.393720 1.933744 3.100826 3.955945
##      rad      tax  ptratio    black    lstat
## 7.484496 9.008554 1.799084 1.348521 2.941491
```

Excluding one variable (`age`, which has high p-value) from multiple regression :—

```
lm.fit1 <- lm(medv ~ . - age, data=Boston)
summary(lm.fit1)
```

```
##
## Call:
## lm(formula = medv ~ . - age, data = Boston)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -15.6054  -2.7313  -0.5188   1.7601  26.2243

## Multiple R-squared:  0.7406, Adjusted R-squared:  0.7343
## F-statistic: 117.3 on 12 and 493 DF,  p-value: < 2.2e-16
```

3.6.4 Interaction Terms

Including interaction terms as follows :-

```
summary(lm(medv ~ lstat*age, data=Boston))
```

```
##
## Call:
## lm(formula = medv ~ lstat * age, data = Boston)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -15.806  -4.045  -1.333   2.085  27.552
##
## Coefficients:
##               Estimate Std. Error t value Pr(>|t|)
## (Intercept) 36.0885359  1.4698355  24.553  < 2e-16 ***
## lstat       -1.3921168  0.1674555  -8.313 8.78e-16 ***
## age         -0.0007209  0.0198792  -0.036   0.9711
## lstat:age    0.0041560  0.0018518   2.244   0.0252 *
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 6.149 on 502 degrees of freedom
## Multiple R-squared:  0.5557, Adjusted R-squared:  0.5531
## F-statistic: 209.3 on 3 and 502 DF,  p-value: < 2.2e-16
```

3.6.5 Non-Linear Transformations of Predictors

```
lm.fit2 <- lm(medv ~ lstat + I(lstat^2), data=Boston)
summary(lm.fit2)
```

```
##
## Call:
## lm(formula = medv ~ lstat + I(lstat^2), data = Boston)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -15.2834  -3.8313  -0.5295   2.3095  25.4148
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept) 42.862007   0.872084   49.15   <2e-16 ***
## lstat       -2.332821   0.123803  -18.84   <2e-16 ***
## I(lstat^2)   0.043547   0.003745   11.63   <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 5.524 on 503 degrees of freedom
## Multiple R-squared:  0.6407, Adjusted R-squared:  0.6393
## F-statistic: 448.5 on 2 and 503 DF,  p-value: < 2.2e-16
```

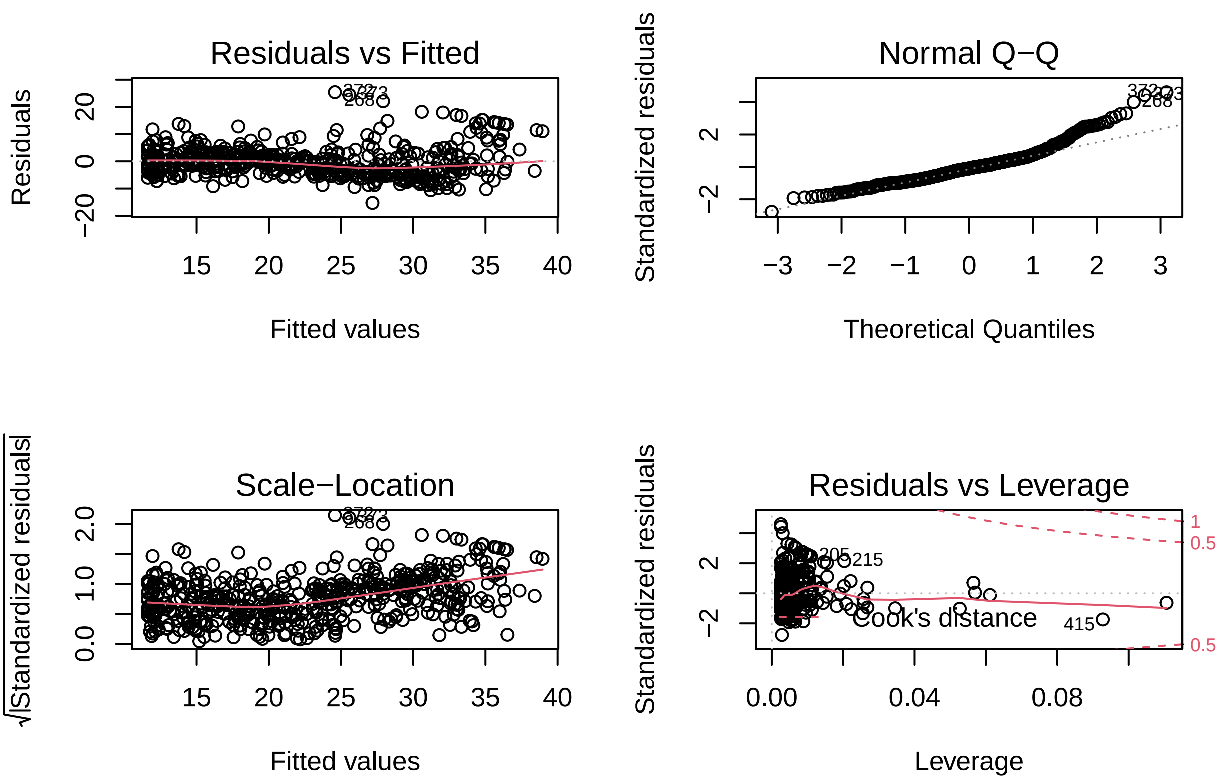
We use anova() function to quantify how much the quadratic fit is better than linear fit. This is shown as below:

```
lm.fit <- lm(medv~lstat, data=Boston)
lm.fit2 <- lm(medv ~ lstat + I(lstat^2), data=Boston)
anova(lm.fit, lm.fit2)
```

```
## Analysis of Variance Table
##
## Model 1: medv ~ lstat
## Model 2: medv ~ lstat + I(lstat^2)
##   Res.Df   RSS Df Sum of Sq     F    Pr(>F)
## 1    504 19472
## 2    503 15347  1    4125.1 135.2 < 2.2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

Hence, the model containing $lstat^2$ is far superior to the simple linear regression model. This is also shown in the the diagnostic plots as below:

```
par(mfrow=c(2,2))
plot(lm.fit2)
```



Now, we use the poly() function with the lm() call to include polynomials of a variable up to any degree.

```
lm.fit5 <- lm(medv ~ poly(lstat,5), data=Boston)
summary(lm.fit5)
```

```
##
## Call:
## lm(formula = medv ~ poly(lstat, 5), data = Boston)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -13.5433  -3.1039  -0.7052   2.0844  27.1153
##
## Coefficients:
##                  Estimate Std. Error t value Pr(>|t|)
## (Intercept)       22.5328     0.2318  97.197  < 2e-16 ***
## poly(lstat, 5)1 -152.4595     5.2148 -29.236  < 2e-16 ***

## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 5.215 on 500 degrees of freedom
## Multiple R-squared:  0.6817, Adjusted R-squared:  0.6785
## F-statistic: 214.2 on 5 and 500 DF,  p-value: < 2.2e-16
```

Lastly, a log transformation of the predictor variable.

```
summary(lm(medv ~ log(lstat), data=Boston))
```

```
##
## Call:
## lm(formula = medv ~ log(lstat), data = Boston)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -14.4599  -3.5006  -0.6686   2.1688  26.0129
##
## Coefficients:
##             Estimate Std. Error t value Pr(>|t|)
## (Intercept)  52.1248     0.9652   54.00   <2e-16 ***
## log(lstat)  -12.4810     0.3946  -31.63   <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 5.329 on 504 degrees of freedom
## Multiple R-squared:  0.6649, Adjusted R-squared:  0.6643
## F-statistic:  1000 on 1 and 504 DF,  p-value: < 2.2e-16
```

3.6.6 Qualitative Predictor

Loading the Carseats data set.

```
data("Carseats")
head(Carseats)
```

```
##   Sales CompPrice Income Advertising Population Price ShelveLoc Age Education
## 1  9.50       138     73          11        276   120       Bad  42        17
## 2 11.22       111     48          16        260    83      Good  65        10
## 3 10.06       113     35          10        269    80    Medium  59        12
## 4  7.40       117    100           4        466    97    Medium  55        14
## 5  4.15       141     64           3        340   128       Bad  38        13
## 6 10.81       124    113          13        501    72       Bad  78        16
##   Urban  US
## 1   Yes Yes
## 2   Yes Yes
## 3   Yes Yes
## 4   Yes Yes
## 5   Yes  No
## 6    No Yes
```

```
attach(Carseats)
```

Now, we create a multiple linear regression with some interaction terms:-

```
lm.fit <- lm(Sales ~ . + Income*Advertising + Price*Age, data=Carseats)
summary(lm.fit)
```

```
##
## Call:
## lm(formula = Sales ~ . + Income * Advertising + Price * Age,
##     data = Carseats)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -2.9208 -0.7503  0.0177  0.6754  3.3413
##
## Coefficients:
##                      Estimate Std. Error t value Pr(>|t|)

## Residual standard error: 1.011 on 386 degrees of freedom
## Multiple R-squared:  0.8761, Adjusted R-squared:  0.8719
## F-statistic:   210 on 13 and 386 DF,  p-value: < 2.2e-16
```

We use the `contrasts()` function to display the dummy coding that `R` uses for qualitative variables such as `ShelveLoc`. We can use `contrasts()` to change the dummy values for different factor levels.

```
contrasts(ShelveLoc)
```

```
##        Good Medium
## Bad       0      0
## Good      1      0
## Medium    0      1
```

3.6.7 Writing Functions

We now write the function to load both libraries `ISLR` and `MASS`.

```
LoadLibraries <- function(){
  library(MASS)
  library(ISLR)
  print("Libraries MASS and ISLR have been loaded!")
}
LoadLibraries()
```

```
## [1] "Libraries MASS and ISLR have been loaded!"
```
